Subject: RE: MC252 - Macondo Well for Insurance Claim
Importance: Normal
Attachments: Macondo Dev Scenario_Expl Well FM-.ppt

Dear Katy and Claudia,

The Macondo exploration well found hydrocarbon sands, which is deemed economically viable based on the well data we obtained. The preliminary development scenario for the exploration well FM has 3 producing wells to deplete the reservoir and the Macondo exploration well is one of the three producers. Since the original well is damaged, we will need to drill another well to replace the original well. The development plan has not been sanctioned yet since the well is still in exploration stage.

The uncontrolled nature of the current flow is expected not to cause reservoir damage.

Jay and Kelly, please feel free to make any changes to the above statement as we are trying to finalize the words. Thanks.

Attached is the summary of the preliminary development scenario. Please note BP farmed out some WI after the expl. well was sanctioned, so the ownership showed on the slide was assumption only at that time.

Please let me know if you have any questions,

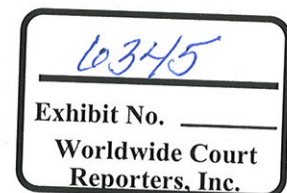

Xuemei

Subject: FW: MC252 - Macondo Well

Xuemei & Claudia,

We had asked Vincent to send this note so we could have the specific request in writing and in his own words. I think it's stated below as we discussed (what is the viability of the reservoir / what does the development plan require). If you can provide the response along with the development plans as evidence, I think that will satisfy their questions on coverage in the claim.

Again, the target to finalize this response is Wednesday morning, so I can make sure there's time for the internal / legal reviews before the Thursday morning meeting.

Subject: MC252 - Macondo Well

Dear Katy,

I refer to our telephone conversation yesterday regarding the potential redrill of the Macondo MC252 well.

In order to ascertain whether or not the well is likely to be redrilled, I would contact BP's Reservoir Engineering division to obtain their point of view on the subject. Reservoir engineers should have the results of the well tests carried out prior to the incident (together with the various LWD -Logging While Drilling- results and probably core samples of the reservoir), which would indicate whether the reservoir is deemed economically viable. Knowing the geological nature of the reservoir, they should also have a good idea as to whether the uncontrolled nature of the flow may result in reservoir damage.

Finally, obtaining the developments plan for this specific reservoir would also be useful.

Please let me know if you have any question.

Best regards

Vincent
