**Importance:** Normal

Anthony good point. Spacer volume was sufficient to sweep entire annulus volume. As such, spacer was sufficient to sweep channel. Subsequent testing with 3D confirms statement that spacer was sufficient...Tommy

Simon and Tommy. Having thought about this from the other side of the desk. I think one of the areas that we have to address is the following

"Halliburton your computer simulator indicated channeling, which lead to mud and cement inter mixing. However you still recommended foam cement. " .....

Kirk Harris shared this info with Bill Hunter this week. Kirk remains in contact with Fred and they regularly meet in Houston.

Simon:

Not surprising.

Who is source of the rumor?...Tommy

Tommy, Anthony,

FYI,.....Fred Sabins is consulting to bp performing an investigation into our foam slurry used on Macondo 252 #1 well. Rumour is he is determined to prove slurry instability as a stand alone system and when contaminated with spacer/mud. I was told that Fred is not a foam supporter and hence is trying to prove a point. Just wanted to keep you abreast of the rumour mill.  
Best Regards,.....

Simon.
