Nice work guys.
Business as usual for the Horizon "A Team".

Kevin, et al
Just to let you know that the Tiber well through the Paleocene has been delivered at Top Quartile performance, even with the extensive appraisal logging program at 35 DD/10k. Also, for reference, if we only include dry hole logging the performance is 32 DD/10k. We are also likely about to set the deepest liner that BP has run in the GOM and likely worldwide - we are checking this.
