Carter,

You may already know about the latest with the Horizon Stack coil faults. This is what I've been told:

- When the stack was brought out of the water and set on deck the coil faults started to clear.
- The rig started cleaning the connections.
- Test found 7 bad and they were replaced.
- After reassembly the fired up the control system for testing and 82 coil fault came up. (Not in the water.)

I hear there's a Cameron guy onboard and I need your best theories.

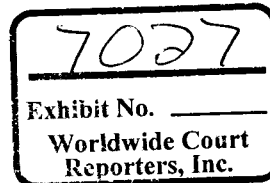

I'll give you a call when I get through talking with the rig.

Thanks,

Tony Kirkland ●●
