Breach & Fracturing

Bob Merrill

MUD sand - if 5ft thick, small volume
then will "fill" in 12 days.

Can we detect if there is cross flow at 18" shoes
Comment - Leak off cannot be detectable.

Kate:

Do we absolutely have to know the
flow rate before the well is shut in
(tophead)

Uncertainties of Shut in top hole pressure.
Aquifer size ← makes a big difference
Depth Rate Repletion Rate } ^{smaller} _{uncertainty}
Leak Size } _{output}

What can you do with AQ vs SP data (slugging
rate test).

Shut in will not further damage the
well integrity ← if rupture disk is intact

4200 - 4700 psi ← current BOP pressure
4375 ← ~~was~~ most recent value.
