In line with our approach not to make the situation worse, our forward actions are being governed by scenario "a". We will ensure our communications capture this.

STATE OF THE WELL (SOW) PAID AND SENT WITH JUST DATA THE FOLLOWING MESSAGE:

Tom and Melissa,

We should get up as soon as possible that the is a modified scenario 2 that gets down the well to the reservoir with counter flow of oil and gas upward that is equal to production without more detailed calculations, this can explain the fast appearance of oil and gas after pumping is stopped and also is a plausible reason of where the lion's share of the mud was during pumping.

This is a special case we are using to make available to the public the possibility that the rupture disk was blown by the accident.

Steve
 Director
 Department of Energy
