Good summary and analysis. Let's face it, they are running this show like a game of scrabble. I suggest you go home. By morning they will have enough letters to attempt a new word.

Subject: RE: Update 29May10

They (Jason Frazier who works for Merrick Kelly) are pressing hard to find a way to move Carter et al without pulling the pod. They are paranoid about pulling the pod. We spoke again to Carter about spooling off the mux and hot line and reterminating on the new vessel. Carter didn't like that idea and neither does TO's Mike Fry or me. We left it by asking Carter and Country to consider how that would be done and what the risks would be as well as brainstorming for alternatives. The big problem here is transferring the cable's weight from the existing tigger. The tigger cable, mux cable and hyd line are all clamped together making this transfer to another vessel in this way highly problematic. Jason, this will be the big topic tomorrow and is per our earlier phone call.

From talking with Jason we now know that BP's Bruce Flanders, who approached us earlier on the same topic, is under the impression this whole exercise is a "no go". The two BP guys didn't even know each other or that the other was working on this. Once again, the right hand doesn't know what the left hand is doing. We need to not knee jerk on any of this.

Looks like a top kill tonight is a no go.

This is the production manifold that Pfluger is designing and Russell started making. I think they would piggy back it on to the JS manifold. They will install chokes on this manifold.

There is talk of developing a method to produce back through the JS manifold. I can envision cutting off the riser kink, and setting down a plate with gasket and diverting flow out the c&k lines.

Subject: RE: Update 29May10

They have not taken TOP KILL off the table. Therefore, they can only go so far in cutting off the riser. This leaves open the possibility of a top kill later. They are cutting off everything they can in preparation for removing the riser when the call IS made to take top kill off the table and move on to TOP HAT.

Subject: Update 29May10

They are making preps to install the "top hat". Doing housework around the flex joint, cutting things away, etc., to prepare for removal of the riser pipe. There is talk that they may pump again later today. I'll see what I can find out.
