

- Model constructed to address impact of crossflow of M57B & M56A gas sands during “top kill”
 - Response of observed pressures
 - GOR variation with time
- Request to investigate whether depletion was consistent with known pressures below BOP
- Requested to avoid making any conclusions regarding likely rates
 - Role of flowrate investigation team

Approach

- Simple: tight timing, multiple unknowns
- Single layer per reservoir (M57B to M56F, with intervening shales)
- 10 x 12 x 17; no structure
